

### The Challenge

In today's world, it's more important than ever to ensure every family can enjoy a home with clean, breathable air. As mold, mildew and other contaminants become a concern in some (particularly old or aging) homes while rates of asthma in children climb steadily, it is increasingly crucial to consider the overall health and safety of residential spaces as an important part of whole-home energy efficiency.

CLEAResult has been helping homeowners, renters, and property managers save energy for decades, and we're already well-versed in the holistic solutions necessary to addressing these issues. Indoor air quality is always on our minds, whether it's the common indoor contaminants mentioned or wildfire smoke. We are uniquely positioned—thanks to our longstanding HEA offerings—to prioritize indoor air quality and deliver healthy homes from top to bottom.

### Our Solution

CLEAResult is adapting our extensive experience in home energy assessments to home health assessments, which conveniently take place at the same time as a standard energy assessment. We're using a certified approach to in-home health assessments, focusing on grading the health of a home by examining key variables to determine overall air quality and root out any potential trouble spots. During a home visit or virtual session, our experts will run through a checklist of key factors that determine the overall health of the home and, based on their findings, will recommend a custom set of upgrades and improvements to customers for their consideration.

It's worth noting that our comprehensive energy assessments have already made a significant impact on in-home health thanks to our unique approach. But during a health-focused assessment, our energy experts will determine if any of the following measures would serve as a beneficial addition to other efficiency measures recommended for the customer's home:

- ✓ HEPA filters
- ✓ HVAC replacement and cleaning
- ✓ Furnace replacement
- ✓ Window insulation
- ✓ Weatherization measures
- ✓ ... And more!

Our offering is designed to not only improve the health of families and individuals. In taking preventative measures that improve indoor air quality and home safety, we can drive down the cost of care in communities across North America—particularly in underserved areas with at-risk populations in older homes or aging units.

Like all CLEAResult solutions, this offering is fully modular and able to combine with other residential programs in our portfolio, such as our HEA offering. We are currently running several pilot programs and, given their immense success, will be rapidly expanding the offering in the near future.
